Claims

We claim:

1. A system that enforces currency constraints on a query on a database system having a query optimizer, a query processing engine and one or more local replicas of data in remote data sources comprising:

a constraint parser that interprets and converts the currency constraint into a form usable by the query optimizer;

a query plan generator that constructs a query plan for executing the query, wherein the plan includes one or more subplan selection operators that check a currency of a local replica against the query's currency constraint and selects the subplan using the local replica only when the constraint is met; and

wherein the query processing engine executes the query plan, including the subplan selection operators, thereby producing a result that satisfies the query's currency constraints.

- 2. The system of claim 1 comprising a currency constraint normalizer that resolves a plurality of currency constraints into a single constraint representing a least upper bound of the currency constraints.
- 3. The system of claim 1 wherein tables in the local replica are grouped into currency regions and wherein the data in all tables in a currency group correspond to the same database state.
- 4. The system of claim 3 comprising a heartbeat mechanism that includes a global heartbeat table and local replicated heartbeat tables that keep track of the currency of local replicas.

- 5. The system of claim 4 wherein the data source selection operator accesses a local heartbeat table to determine whether the currency of local replica meets the currency constraint.
- 6. The system of claim 1 wherein the query optimizer estimates a cost associated with a query plan to be executed using a local replica based on a probability that the local replica will meet the currency constraint of the query.
- 7. The system of claim 1 wherein the currency constraints includes a consistency constraint and wherein the constraint parser parses the consistency constraint.
- 8. The system of claim 7 wherein the query plan generator verifies possible query plans against the query's consistency constraint and rejects plans that do not meet the consistency constraint.
- 9. The system of claim 7 comprising a consistency constraint normalizer that resolves a plurality of consistency constraints into a single consistency constraint representing a least upper bound of the constraints.
- 10. The system of claim 7 comprising a mechanism for enforcing timeline consistency constraints that appends a query's currency constraint with an additional session-specific currency bound specifying that the query's input data must reflect a database state later than or equal to the latest database state of any input used by designated prior queries within the same session.
- 11. The system of claim 8 wherein the query plan generator derives a delivered consistency property for each plan based on physical operators in the plan and compares the delivered consistency with the query's consistency constraint.

12. The system of claim 8 wherein local replicas are grouped into currency regions and wherein the query plan generator verifies that all inputs in a query plan that must be consistent belong to the same currency region.

13. A method for specifying and enforcing currency and consistency requirements associated with a database query, comprising:

parsing a currency and consistency constraint to interpret and convert the constraint into a form usable by a query optimizer;

constructing query execution plans that include a subplan selection operator that verifies a currency of a local replica against the query's currency constraint and selects the subplan using the local replica only when the local replica's data meets the currency constraint;

verifying the query execution plans against the query's consistency constraints and rejecting any plans that do not meet the consistency constraint; and executing the query plan, including any subplan selection operators, thereby producing a result that satisfies the query's currency and consistency constraints.

- 14. The method of claim 13 comprising resolving a plurality of currency and consistency constraints associated with the database query into a single currency and consistency constraint that represents a least upper bound of the constraints.
- 15. The method of claim 14 comprising grouping local replicas into currency regions wherein the data in all replicas within a currency region always reflect the same database state.
- 16. The method of claim 15 comprising utilizing a heartbeat mechanism to maintain a global heartbeat table and local replicated heartbeat tables that keep track of the currency of local replicas.
- 17. The method of claim 16 wherein the subplan selection operator refers to information in a log to verify the currency of the local replica.

- 18. The method of claim 15 wherein possible query plans are evaluated by determining a delivered consistency based on physical operators in the query plan that group input tables into sets of consistent input tables and verifies that the input tables in a set of consistent input tables belong to the same currency region.
- 19. The method of claim 13 comprising estimating a cost associated with a query plan to be executed using a local replica based on a probability that the local replica will meet the currency constraint of the query.
- 20. Computer-readable media comprising computer-executable instructions for performing the method of claim 13.

21. For use with a database system, computer readable media comprising computer-executable instructions for enforcing currency constraints on a query on the database system, wherein the database system has local replicas of data in remote data sources, the instructions comprising:

interpreting and converting the currency constraint into a form usable by a query optimizer;

constructing a query plan for executing the query, wherein the plan includes a subplan selection operator that checks a currency of a local replica against the query's currency constraint and selects the subplan using the local replica only when the constraint is met; and

executing the query plan, including the subplan selection operators, thereby producing a result that satisfies the query's currency requirements.

- 22. The computer readable media of claim 21 wherein the instructions comprise resolving a plurality of currency constraints into a single constraint that represents a least upper bound of the currency constraints.
- 23. The computer readable media of claim 21 wherein the instructions comprise grouping local replicas into currency regions and wherein the data in all replicas within a currency region always reflect the same database state.
- 24. The computer readable media of claim 23 wherein the instructions comprise utilizing a heartbeat mechanism to maintain a global heartbeat table and local replicated heartbeat tables that track the currency of local replicas.

- 25. The computer readable media of claim 24 wherein the subplan selection operator accesses a local heartbeat table to determine whether the currency of local data source meets the currency constraint.
- 26. The computer readable media of claim 21 wherein the instructions comprise estimating a cost associated with a query plan to be executed using a local replica based on a probability that the local replica will meet the currency constraint of the query.
- 27. The computer readable media of claim 21 wherein the currency constraints include a consistency constraint and wherein the instructions comprise parsing the consistency constraint.
- 28. The computer readable media of claim 27 wherein the instructions comprise verifying possible query plans against the query's consistency constraint and rejecting plans that do not meet the consistency constraint.
- 29. The computer readable media of claim 28 wherein the instructions comprise resolving a plurality of consistency constraints into a single consistency constraint that represents a least upper bound of the constraints.
- 30. The computer readable media of claim 27 wherein the instructions comprise deriving a delivered consistency property for each plan based on physical operators in the plan and comparing the delivered consistency with the query's consistency constraint.
- 31. The computer readable media of claim 28 wherein the instructions comprise grouping local replicas into currency regions and verifying that all inputs in a query plan that must be consistent belong to the same currency region.

32. An apparatus for specifying and enforcing currency and consistency requirements associated with a database query, comprising:

means for interpreting and converting the currency constraint into a form usable by a query optimizer;

means for constructing a query plan for executing the query, wherein the plan includes a subplan selection operator that checks a currency of a local replica against the query's currency constraint and selects the subplan using the local replica only when the constraint is met; and

means for executing the query plan, including the subplan selection operators, thereby producing a result that satisfies the query's currency requirements.

- 33. The apparatus of claim 32 including means for resolving a plurality of currency constraints into a single constraint that represents a least upper bound of the currency constraints.
- 34. The apparatus of claim 32 comprising means for grouping local replicas into currency regions and wherein the data in all replicas within a currency region always reflects the same database state.
- 35. The apparatus of claim 34 wherein the means for grouping utilizes a heartbeat mechanism to maintain a global heartbeat table and local replicated heartbeat tables that track the currency of local replicas.
- 36. The apparatus of claim 35 wherein the subplan selection operator accesses a local heartbeat table to determine whether the currency of local data source meets the currency constraint.

- 37. The apparatus of claim 32 comprising means for estimating a cost associated with a query plan to be executed using a local replica based on a probability that the local replica will meet the currency constraint of the query.
- 38. The apparatus of claim 32 wherein the currency constraints include a consistency constraint and comprising means for interpreting and converting the consistency constraint.
- 39. The apparatus of claim 38 comprising means for verifying possible query plans against the query's consistency constraint and rejecting plans that do not meet the consistency constraint.
- 40. The apparatus of claim 39 comprising means for resolving a plurality of consistency constraints into a single consistency constraint that represents a least upper bound of the constraints.
- 41. The apparatus of claim 38 comprising means for deriving a delivered consistency property for each plan based on physical operators in the plan and comparing the delivered consistency with the query's consistency constraint.
